Communication Access: A Basic Human Right

Aphasia affects a person's ability to communicate, not their intellect. People with aphasia—and countless others—face barriers to communication on a daily basis.

According to the Joint Commission, 60-70% of patient harm in hospitals is associated with lack of effective communication.

Break down the barriers

93% of stroke survivors with aphasia experience high psychological distress.

- Hilari et al (2010, 2011)
